LAB 1 REPORT

CYOP 300 - BUILDING SECURE WEB APPLICATIONS

Alberth Matos

17 March 2026

Executive Summary

This lab consists of my attempt at creating a voter registration offer system, suitable for use via terminal to query the user for their age and nationality, and, if they are in the range 18 >= age <= 120, offer to register them. In the case where age is >= 100, but <= 120, we ask them to confirm their age. If age is > 120, we reject the registration attempt, and direct the user to a local official.

Full, detailed, test coverage for all modules are included in test_lab1.py, and were run using pytest.

No particular issues were encountered in the lab. The only 3rd party package used was pytest, which is specified in the lab's requirements.txt.

Of note, the requirements did not state whether a full address should be captured. Accordingly, for the output, I chose a fictional street address and city.
